

How to get the best results with the Sniper Tattoo Photography Set

For achieving optimal results, it is necessary to adjust your settings to suit the conditions around you.

For instance, If you're in a room with cold ambient colours it is recommended to adjust the light intensity to 25-40% and a relatively warm temperature of 3500-4500K.

Alternatively, if you're in a darker room with warm colours you can achieve better results with higher light intensity and colder temperatures.

Generally, it's best to have a neutral, dark backdrop and as little direct light as possible. Always aim to find a location for photography that offers these conditions.

Remember, it's your photo and your style, so think about the effect you want to create. Tattoos are as unique as the people who wear them, and your photo should be too.

You are welcome to experiment and see what settings work best for you and your style.

It's crucial to bear in mind that while this photography set provides you with the optimal conditions for a tattoo photograph, the final quality of the picture depends on the limitations of your smartphone camera. Therefore, if the image quality doesn't meet your expectations, consider capturing your photo using a different smartphone with superior camera capabilities.
